Finding Balance: Why India's First Hybrid SIFs Deserve a Place in Your Portfolio

By: Bhavesh Jain, Co-Head – Factor Investing, Edelweiss MF

Most investors want one simple thing: returns that beat the bank account, but without the kind of stomach-churning volatility that makes you regret opening your portfolio app. The catch is that money rarely works in such straight lines. Markets have a habit of humbling even seasoned investors, reminding us that certainty is usually an illusion. Within the hybrid funds while arbitrage funds feel safe, but their returns barely move the needle. Meanwhile, other equity oriented hybrid funds with moderate equity, has historically given the average returns over 3 years in a range that is more acceptable to investors, but the ups and downs are still sharp. So where do you turn if you want something in between?

Think of this in terms of identifying leadership in a fast-moving world. A good leader does not chase every opportunity with reckless speed, nor do they freeze in indecision. The real strength lies in balance: knowing when to push forward boldly, when to hold back, and how to keep the team moving steadily. That is exactly what a hybrid Specialised Investment Fund (SIF) is designed to do. It blends caution with ambition, structure with flexibility. The intent is not to thrill in bull markets or despair in corrections, but to travel a more even path. The aim is to give average returns that are acceptable to investors while lowering the up and down (i.e. volatility) in the fund.

The newly launched Altiva Hybrid Long-Short Fund from Edelweiss AMC is a prime example. Unlike a hybrid mutual fund, which mixes equity and debt in fixed ways, this sits within the new SIF framework created by SEBI. That framework allows professional managers more room to use strategies that were once the domain of institutions and AIFs, things like equity arbitrage, special situation trades around IPOs or buybacks, and derivative positions. This flexibility gives the fund a chance to adapt faster to changing market cycles, an advantage retail investor rarely access directly. Add in a layer of high-quality fixed income, and you have a fund that seeks to deliver absolute returns: not linked to the direction of the market, but to the smartness of the strategy.

Back-tested numbers of such strategy tell an encouraging story. Over three to five years, the strategy has shown annualised returns in the 10–11 per cent range, compared with 6–7 per cent from arbitrage funds. Importantly, volatility has stayed far below hybrid mutual funds. The recipe is fairly balanced: about half in fixed income, one-fifth in arbitrage, another third in carefully chosen derivative trades, and a small slice, around five to ten percent, in special opportunities like IPOs, mergers or index inclusions/ exclusions. Each element is designed to play a role, just as every dish in a thali balances the others.

***Source: Internal. Strategy performance is derived using back tested data**

For investors, the appeal is clear. If you have at least 10 lakh to allocate, this can be that middle seat in your portfolio: less exciting than an aggressive hybrid mutual fund, but far more rewarding than parking everything in short-term debt. A simple rule of thumb works well, think of allocating five to fifteen percent of your investable wealth here, provided you are willing to hold for at least two to three years. The returns are unlikely to beat a roaring bull market, but they should be better than fixed income while keeping the ride steady and balance.

The real strength of a hybrid SIF lies in habit, not hype. It is about taking a long-term view, diversifying sensibly, and trusting a process that has been designed to do better than the plain vanilla while avoiding the anxiety of pure risk-taking. In that sense, it is like the lamp you light during Diwali; it may not dazzle like fireworks, but it shines steadily, night after night, giving comfort and balance.

The choice, as always, is yours. If you have the capital and the patience, consider letting a hybrid SIF quietly complement the rest of your investments. Build your core, add a little sophistication, and then step back. Money is best enjoyed when it allows you to focus on life: holidays with family, hobbies on weekends, and peace of mind on ordinary days.

Notes:
1. Different plans shall have different expense structure. The performance details provided herein are of Direct Plan of the funds. Returns are for Growth Option only. Since inception returns are calculated on Rs. 10/- invested at inception of the scheme. In case the start/end date is non business day, the NAV of previous day is used for computation. For Edelweiss Liquid Fund, Since Inception returns are calculated on Rs. 1000/- invested at inception of the scheme.
2. Past performance may or may not be sustained in future and should not be used as a basis for comparison with other investments.
3. **Since respective schemes/ options have not completed relevant period (3yr or 5yr) after allotment or units were not available throughout the respective period, no returns are available.
4. @ Returns are annualized * CAGR Return.

Mutual Fund is one of the best platforms for investors, but the real problem lies in selecting an appropriate fund. MFs provide solution for all type of investors either looking for long term wealth creation or looking for a short term investment solution with lower risk. Although investing without right advice is never recommended but let's learn the basics of choosing an appropriate suitable fund.

How to select an equity fund ?

1. Are you willing to take risk or not?

Riskiness of the fund is first thing one should look before selecting a fund. There are three things one should check before investing. First is Equity allocation; higher the Equity allocation, riskier the fund. Second is Market Cap allocation; funds which have higher small cap allocation are most risky than midcap and lastly the large caps. The third parameter investor should look at is the standard deviation of the fund. Higher the Standard Deviation, riskier the fund. (Assuming 1 being riskiest)

Equity Level	Market Cap Allocation	Risk Ranking
97%	70% Small Cap	1
99%	30% Midcap	2
69%	Midcap 70% Large cap 30%	3

2. Check the Portfolio Turnover Ratio

Portfolio Turnover ratio indicates the proportion of stocks that have changed in the period. The higher the ratio, more the churn of the stocks. For better analysis one should look at turnover ratio of only equity portion. Lower turnover indicates higher conviction of the Fund manager.

3. Check the Sharpe Ratio.

Sharpe Ratio is used to understand the return of an investment compared to the risk. This ratio is calculated by average return earned in excess of the price fluctuation of the fund. This ratio is used to understand that the higher return generated by the fund is a result of additional risk or not.

4. Top 10 and number of Stocks

Top 10 holding as well as number of stocks indicate the concentration of the portfolio. If the number of stocks are too less than the portfolio is considered to be riskier compared to more diversified portfolio. Please note over diversification can also lead to performance dilution.

5. Active Bets

Active Bets means percentage of allocation which is away from the Benchmark. Higher Active bet means that the higher conviction of the fund manager which helps in generating better returns compared to the Benchmark.

How to choose a suitable Fixed Income Mutual Fund?

1. Check the Maturity Profile

This is one of the most important aspect in choosing a Debt Fund. Generally, funds with higher maturity are more prone to price movement risk due to interest rate changes. Hence investors with short term investment horizon should invest in fund with less average maturity like for example investors looking for short term parking can invest into Liquid Fund.

2. Keep an eye on Credit Profile

Investors should closely watch the credit allocation of the fund as those investing in higher (AAA) rated bonds are less exposed to any credit risks compared to those investing in lower rated papers. Following is the list of credit rating along with its riskiness.

Long Term Credit Rating	Perceived Riskiness
Sovereign	
AAA	
AA	
A	
BBB	
BB	
B	
Junk	

3. Check the Fund YTM.

Yield to maturity (YTM) is the total return anticipated if the underlying bond is held until it matures. In Fixed Income Mutual Fund, it is weighted Average yield of all bonds invested by the scheme. YTM of a Fund broadly varies with two parameters; Market Movement (Interest Rate Change, Valuation, Rating changes) and AUM outflow/inflow. Thus, YTM is not the best indicator of return of open debt mutual fund and investors use this only for indication and relative comparison.

4. Check Individual Holding

Even if a product looks suitable for investment from both Maturity as well as Credit Quality point of view; Investors should look at overall portfolio concentration i.e. if the total number of securities in the portfolio are very less, portfolio concentration increases and hence the diversification risk.

5. Asset Allocation

One should check that the overall asset allocation of the fund is in line with the investment objective or not i.e. it should be true to label. Also, check the cash level of the fund as with excess cash surplus in portfolio investor loses on the returns.

Fund Manager : An employee of the asset management company such as a mutual fund or life insurer, who manages investments of the scheme. He is usually part of a larger team of fund managers and research analysts.

Application Amount for Fresh Subscription : This is the minimum investment amount for a new investor in a mutual fund scheme.

Minimum Additional Amount : This is the minimum investment amount for an existing investor in a mutual fund scheme.

Yield to Maturity : The Yield to Maturity or the YTM is the rate of return anticipated on a bond if held until maturity. YTM is expressed as an annual rate. The YTM factors in the bond's current market price, par value, coupon interest rate and time to maturity.

SIP : SIP or systematic investment plan works on the principle of making periodic investments of a fixed sum. It works similar to a recurring bank deposit. For instance, an investor may opt for an SIP that invests Rs 500 every 15th of the month in an equity fund for a period of three years.

NAV : The NAV or the net asset value is the total asset value per unit of the mutual fund after deducting all related and permissible expenses. The NAV is calculated at the end of every business day. It is the value at which the investor enters or exits the mutual fund.

Benchmark : A group of securities, usually a market index, whose performance is used as a standard or benchmark to measure investment performance of mutual funds, among other investments. Some typical benchmarks include the Nifty, Sensex, BSE200, BSE500, 10-Year Gsec.

Entry Load : A mutual fund may have a sales charge or load at the time of entry and/or exit to compensate the distributor/agent. Entry load is charged at the time an investor purchases the units of a mutual fund. The entry load is added to the prevailing NAV at the time of investment. For instance, if the NAV is Rs. 100 and the entry load is 1%, the investor will enter the fund at Rs 101.

Note: SEBI, vide circular dated June 30, 2009 has abolished entry load and mandated that the upfront commission to distributors will be paid by the investor directly to the distributor, based on his assessment of various factors including the service rendered by the distributor

Exit Load : Exit load is charged at the time an investor redeems the units of a mutual fund. The exit load is deducted from the prevailing NAV at the time of redemption. For instance, if the NAV is Rs 100 and the exit load is 1%, the redemption price would be Rs 99 Per Unit.

Modified Duration : Modified duration is the price sensitivity and the percentage change in price for a unit change in yield

Standard Deviation : Standard deviation is a statistical measure of the range of an investment's performance. When a mutual fund has a high standard deviation, it means its range of performance is wide, implying greater volatility.

Sharpe Ratio : The Sharpe Ratio, named after its founder, the Nobel Laureate William Sharpe, is a measure of risk-adjusted returns. It is calculated using standard deviation and excess return to determine reward per unit of risk.

Beta : Beta is a measure of an investment's volatility vis-à-vis the market. Beta of less than 1 means that the security will be less volatile than the market. A beta of greater than 1 implies that the security's price will be more volatile than the market.

AUM : AUM or assets under management refers to the recent / updated cumulative market value of investments managed by a mutual fund or any investment firm.

Holdings : The holdings or the portfolio is a mutual fund's latest or updated reported statement of investments/securities. These are usually displayed in terms of percentage to net assets or the rupee value or both. The objective is to give investors an idea of where their money is being invested by the fund manager.

Nature of Scheme : The investment objective and underlying investments determine the nature of the mutual fund scheme. For instance, a mutual fund that aims at generating capital appreciation by investing in stock markets is an equity fund or growth fund. Likewise, a mutual fund that aims at capital preservation by investing in debt markets is a debt fund or income fund. Each of these categories may have subcategories.

Rating Profile : Mutual funds invest in securities after evaluating their creditworthiness as disclosed by the ratings. A depiction of the mutual fund in various investments based on their ratings becomes the rating profile of the fund. Typically, this is a feature of debt funds.

Potential Risk Class : A Potential Risk Class matrix consists of parameters based on maximum interest rate risk (measured by Macaulay Duration (MD) of the scheme) and maximum credit risk (measured by Credit Risk Value (CRV) of the scheme).
